

SMART CONTRACT CODE REVIEW AND SECURITY ANALYSIS REPORT

Date: September 24th, 2021

This document may contain confidential information about IT systems and the intellectual property of the Customer as well as information about potential vulnerabilities and methods of their exploitation.

The report containing confidential information can be used internally by the Customer, or it can be disclosed publicly after all vulnerabilities are fixed — upon a decision of the Customer.

Document

Name	Smart Contract Code Review and Security Analysis Report for Terablock.
Approved by	Andrew Matiukhin CTO Hacken OU
Туре	ERC20 Token
Platform	Ethereum / Solidity
Methods	Architecture Review, Functional Testing, Computer-Aided Verification, Manual Review
Git repository	https://github.com/TeraBlock/terablock- token/tree/b34b1385b177683b8af2fcd5806080ded92b7d21
Technical	NO
Documentation	
JS tests	YES
Timeline	21 SEPTEMBER 2021 - 24 SEPTEMBER 2021
Changelog	24 SEPTEMBER 2021 - INITIAL AUDIT

Hacken OÜ Parda 4, Kesklinn, Tallinn, 10151 Harju Maakond, Eesti, Kesklinna, Estonia support@hacken.io

Introduction

Hacken OÜ (Consultant) was contracted by Terablock (Customer) to conduct a Smart Contract Code Review and Security Analysis. This report presents the findings of the security assessment of the Customer's smart contract and its code review conducted between September 21st, 2021 - September 24th, 2021.

Scope

The scope of the project is smart contracts in the repository:

Github:

https://github.com/TeraBlock/terablock-token

Commit:

b34b1385b177683b8af2fcd5806080ded92b7d21

Technical Documentation: No

JS tests: Yes Contracts:

TeraBlockToken.sol

We have scanned this smart contract for commonly known and more specific vulnerabilities. Here are some of the commonly known vulnerabilities that are considered:

Category	Check Item
Code review	Reentrancy
	Ownership Takeover
	Timestamp Dependence
	Gas Limit and Loops
	DoS with (Unexpected) Throw
	DoS with Block Gas Limit
	 Transaction-Ordering Dependence
	Style guide violation
	Costly Loop
	ERC20 API violation
	Unchecked external call
	Unchecked math
	Unsafe type inference
	Implicit visibility level
	Deployment Consistency
	Repository Consistency
	■ Data Consistency

Functional review

- Business Logics Review
- Functionality Checks
- Access Control & Authorization
- Escrow manipulation
- Token Supply manipulation
- Assets integrity
- User Balances manipulation
- Data Consistency manipulation
- Kill-Switch Mechanism
- Operation Trails & Event Generation

Executive Summary

According to the assessment, the Customer's smart contracts are secured.

Our team performed an analysis of code functionality, manual audit, and automated checks with Mythril and Slither. All issues found during automated analysis were manually reviewed, and important vulnerabilities are presented in the Audit overview section. All found issues can be found in the Audit overview section.

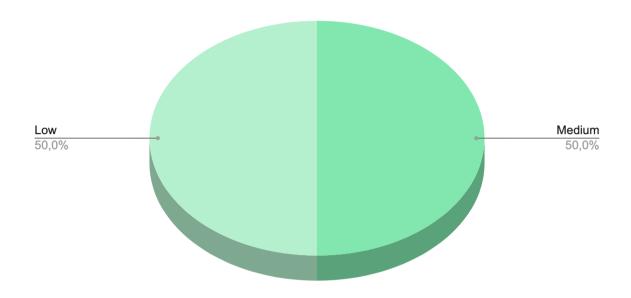

As a result of the audit, security engineers found 1 medium and 1 low severity issue.

Notice:

The TeraBlockToken contract includes unlimited minting ability for admin.

Graph 1. The distribution of vulnerabilities after the audit.

Severity Definitions

Risk Level	Description
Critical	Critical vulnerabilities are usually straightforward to exploit and can lead to assets loss or data manipulations.
High	High-level vulnerabilities are difficult to exploit; however, they also have a significant impact on smart contract execution, e.g., public access to crucial functions
Medium	Medium-level vulnerabilities are important to fix; however, they can't lead to assets loss or data manipulations.
Low	Low-level vulnerabilities are mostly related to outdated, unused, etc. code snippets that can't have a significant impact on execution

Audit overview

■ ■ ■ Critical

No critical issues were found.

High

No high severity issues were found.

■ ■ Medium

1. Admin could mint unlimited

Admin could mint any amount of tokens to any address at any time. Unlimited supply could be very risky for the market price.

Recommendation: please make sure the community is informed about the unlimited token supply.

Lines: TeraBlockToken.sol#13-15

```
function mint(address to, uint256 amount) external onlyAdmin
whenNotPaused {
    _mint(to, amount);
}
```

Customer Comments: The admin owned mint and burn functions in the contracts is an intended functionality.

The vision of the project is to go multi-chain and also to enable multi-chain transfers using a single bridge, rather than the conventional dual chain bridges.

However, to achieve transparency in the system - the admin address would be whitelisted and monitored for every transaction being done. TeraBlock's official website will have a dedicated 'ecosystem transparency' section with complete details about the total supply, circulating supplies on different chains and also admins transactions' watcher. Hence, ensuring trust and transparency.

Low

1. A public function that could be declared external

public functions that are never called by the contract should be declared external to save gas.

Recommendation: Use the external attribute for functions never called from the contract.

<u>Lines: AccessProtected.sol#29</u>

```
function isAdmin(address admin) public view returns (bool) {
```

Conclusion

Smart contracts within the scope were manually reviewed and analyzed with static analysis tools.

The audit report contains all found security vulnerabilities and other issues in the reviewed code.

As a result of the audit, security engineers found 1 medium and 1 low severity issue.

Notice:

The TeraBlockToken contract includes unlimited minting ability for admin.

Disclaimers

Hacken Disclaimer

The smart contracts given for audit have been analyzed in accordance with the best industry practices at the date of this report, in relation to cybersecurity vulnerabilities and issues in smart contract source code, the details of which are disclosed in this report (Source Code); the Source Code compilation, deployment, and functionality (performing the intended functions).

The audit makes no statements or warranties on the security of the code. It also cannot be considered as a sufficient assessment regarding the utility and safety of the code, bug-free status, or any other statements of the contract. While we have done our best in conducting the analysis and producing this report, it is important to note that you should not rely on this report only — we recommend proceeding with several independent audits and a public bug bounty program to ensure the security of smart contracts.

Technical Disclaimer

Smart contracts are deployed and executed on a blockchain platform. The platform, its programming language, and other software related to the smart contract can have vulnerabilities that can lead to hacks. Thus, the audit can't guarantee the explicit security of the audited smart contracts.
